

Setup of any TSS application is delivered via CISP site www.cisp.spb.ru as an archive file therefore you should first unpack the archive, then run the setup and follow the instructions.

The archives with the setups for data processing applications ADaExpert, TDPro and RCPro contain two separate setups - for the application and for data (TFC) converter. TFC converter is installed individually.

Before installing an application, make sure that your system configuration meets the requirements:

- CPU: Intel Pentium or later, multi-core processor is highly recommended.
- Operating system: Windows XP, 7, 8, 10
- RAM: 1024 Mb; Free hard disk space: 50 Mb; CD-ROM
- MS World and Excel 2003 and later installed

The following procedure describes how to **install an application** directly **from the CD**:

1. Start Windows and make sure that you close all open applications.
2. Insert the TSS installation CD in your CD-ROM.
3. Double-click **My Computer** on the Desktop.
4. Double-click on the CD-ROM icon.
5. Double-click on the **application** folder
6. Double-click on the **Setup** icon.

A progress indicator appears. Wait some time while the Setup program is preparing the InstallShield(r) Wizard. Then the welcome window appears. Click Next and follow the instructions on the screen.

During setup you can:

- specify the user information (name and company);
- set the destination folder.
- specify the program folder in which you want to include the software after installation (Thermal Safety, by default).

ATTENTION!

*Windows 7 and later essentially limit the ability of a program to save intermediate and service files generated in the course of its functioning. To avoid any problems of this kind we strongly recommend to install any TSS application along the default path **C:\Users\{username}\CISP\{application name}**.*

You can cancel setup at any step by clicking Cancel, or return to the previous step by clicking Back.

Do the same to install the TFC with one exception - the destination folder is predefined and cannot be changed.

Installing an application from Hard Disk

Instead of installing the software from CD, you can install the software directly from the hard disk. This option is convenient if you made a copy of the installation files on the hard disk or downloaded the installation files from our site www.cisp.spb.ru.

If the installation files are on CD, copy the installation folder to the hard disk and start setup from there.

If you downloaded the installation package from our website, create the installation folder on the hard disk, unpack the installation files into it to get an application setup (and TFC setup in the case of data processing applications), then run setup.exe from there.

To uninstall an application, open the Windows Control Panel and click Add/Remove Programs. Select the application name in the Install/Uninstall tab and click Add/Remove. Confirm your choice by clicking Yes. When the components are removed, click Ok.

Note

After the software is uninstalled, some files may still remain in the program folder. These files were created by the program and may contain some data important for the user. If you are sure that you don't need the files anymore, delete them manually.
